EVQ8626-D-00A

High Efficiency, 16V, 6A Synchronous Step-down Converter Evaluation Board

DESCRIPTION

The EVQ8626-D-00A is an evaluation board for the MPQ8626, a high efficiency, monolithic, synchronous step-down converter.

The EV board can deliver 6A continuous load current over a wide operating input range. High efficiency can be achieved over a wide output current load range.

The MPQ8626 adopts internally compensated constant-on-time (COT) control mode that provides fast transient response and eases loop stabilization.

This EV board can be turned on or off via a remote ON/OFF input (EN) that is referenced to ground. This input is compatible with popular logic devices.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	8-16	V
Output Voltage	V_{OUT}	1.8	V
Output Current	I_{OUT}	6	A

FEATURES

- Wide Input Voltage Range from 2.85V:
 - 2.85V to 16V with External 3.3V VCC Bias
 - 4V to 16V with Internal VCC Bias or External 3.3V Bias
- Programmable Accurate Current Limit Level
- 6A Output Current
- Low $R_{DS(ON)}$ Integrated Power MOSFETs
- Proprietary Switching Loss Reduction Technique

- Adaptive COT for Ultrafast Transient Response
- Stable with Zero-ESR Output Capacitor
- 0.5% Reference Voltage Over 0°C to +70°C Junction Temperature Range
- 1% Reference Voltage Over -40°C to +125°C Junction Temperature Range
- Selectable Pulse-Skip or Forced-CCM Operation
- Excellent Load Regulation
- Output Voltage Tracking
- Output Voltage Discharge
- PGOOD Active Clamped Low Level during Power Failure
- Programmable Soft Start Time from 1ms
- Pre-Bias Start up
- Selectable Switching Frequency of 600kHz, 1100kHz and 2000kHz
- Non-Latch for OCP, OVP, UVP, UVLO and Thermal Shutdown.
- Output Adjustable from 0.6V to 90%* V_{in} , Up to 5.5V max.
- Available in a QFN2X3 mm Package

APPLICATIONS

- Telecom and Networking Systems
- Server, Cloud-Computing, Storage
- Base Stations
- General Purpose Point-of-Load (PoL)
- 12V Distribution Power Systems
- High-end TV
- Game Consoles and Graphic Cards

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance.

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

EVB TEST RESULTS

Performance waveforms are tested on the EVQ8626-D-00A evaluation board.

$V_{IN} = 12V$, $V_{OUT} = 1.8V$, $L = 1\mu H$, $T_A = +25^\circ C$, unless otherwise noted.

EVB TEST RESULTS *(continued)*

Performance waveforms are tested on the EVQ8626-D-00A evaluation board.

$V_{IN} = 12V$, $V_{OUT} = 1.8V$, $L = 1\mu H$, $T_A = +25^\circ C$, unless otherwise noted.

Steady State

$I_{OUT} = 0A$, Pulse Skip

Steady State

$I_{OUT} = 0.5A$, Pulse Skip

Steady State

$I_{OUT} = 6A$, Pulse Skip

Steady State

$I_{OUT} = 0A$, Forced CCM

Steady State

$I_{OUT} = 6A$, Forced CCM

Load Transient

$I_{OUT} = 0A-3A$, Pulse Skip

Load Transient

$I_{OUT} = 0A-3A$, Forced CCM

Power Up through EN

$I_{OUT} = 0A$, Pulse Skip

Power Up through EN

$I_{OUT} = 6A$, Pulse Skip

QUICK START GUIDE

The input voltage of the EV board can range from 8V to 16V. The minimum 8V input voltage is limited by the EN signal, which is derived from VIN through a resistor divider (R3 and R4). Lower input voltage (as low as 2.85V with external 3.3V VCC bias) can be set by fine tuning the resistor divider values, or by over-driving the EN with an external control signal. The following is the procedure to turn on the EV board.

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output voltage between 8V and 16V, and then turn off the power supply.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively. Make sure the power supply has current limit high enough to supply the power.
4. Turn the power supply on. The EVQ8626-D-00A will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.5V to turn on the regulator or less than 0.8V to turn it off.
6. Use R1 and R2 to set the output voltage with $V_{FB} = 0.6\text{ V}$. Follow the Application Information section in the device datasheet to select the proper values of R1, R2, inductor and output capacitor values when output voltage is changed.
7. The JP1 jumper can be used to select the operating frequency (600kHz, 1100kHz or 2000kHz) and light load operation mode (Pulse Skip or CCM).
