DESCRIPTION/ORDERING INFORMATION

The TUSB2551 is a single-chip transceiver that complies with the physical-layer specifications of universal serial bus (USB) 2.0. The device supports both full-speed (12-Mbit/s) and low-speed (1.5-Mbit/s) operation. The TUSB2551 delivers superior edge rate control, producing crisper eye diagrams, which ease the task of passing USB compliance testing.

A dual supply-voltage operation allows the TUSB2551 to reference the system interface I/O signals to a supply voltage down to 1.6 V, while independently powered by the USB $V_{CC(5.0)}$. This allows the system interface to operate at its core voltage without the addition of buffering logic, and also reduce system operating current.

Power-Supply Configurations

The TUSB2551 can be used with different power-supply configurations, which can be dynamically changed. An overview is given in [Table 1](#).

- Normal mode – Both $V_{CC(I/O)}$ and $V_{CC(5.0)}$ or $V_{CC(5.0)}$ and $V_{reg(3.3)}$ are connected. For 5-V operation, $V_{CC(5.0)}$ is connected to a 5-V source (4 V to 5.5 V). The internal voltage regulator then produces 3.3 V for the USB connections. For 3.3-V operation, both $V_{CC(5.0)}$ and $V_{reg(3.3)}$ are connected to a 3.3-V source (3 V to 3.6 V). $V_{CC(I/O)}$ is independently connected to a voltage source (1.65 V to 3.6 V), depending on the supply voltage of the external circuit.
- Disable mode – $V_{CC(I/O)}$ is not connected; $V_{CC(5.0)}$ or $V_{CC(5.0)}$ and $V_{reg(3.3)}$ are connected. In this mode, the internal circuits of the TUSB2551 ensure that the D+ and D– pins are in 3-state, and the power consumption drops to the low-power (suspended) state level. Some hysteresis is built into the detection of $V_{CC(I/O)}$ lost.
- Sharing mode – $V_{CC(I/O)}$ is connected; $V_{CC(5.0)}$ and $V_{reg(3.3)}$ are not connected. In this mode, the D+ and D– pins are made 3-state, and the TUSB2551 allows external signals of up to 3.6 V to share the D+ and D– lines. The internal circuits of the TUSB2551 ensure that virtually no current (maximum 10 mA) is drawn via the D+ and D– lines. The power consumption through $V_{CC(I/O)}$ drops to the low-power (suspended) state level. Both the VP and VM pins are driven HIGH to indicate this mode. Pin RCV is made LOW. Some hysteresis is built into the detection of $V_{reg(3.3)}$ lost.

Table 1. Power-Supply Configuration Overview

Configuration Mode	VBUS/VTRM	VIF	Notes

Disconnect (D+/D– sharing)	Open	Connected	VP/VM are HIGH outputs, RCV is LOW. With OE# = 0 and SUSPEND = 1, data lines may be driven with external devices up to 3.6 V. With D+, D– floating, $I_{CC(I/O)}$ draws less than 1 μ A.
Disconnect	Ground	Connected	VP/VM are HIGH outputs, RCV is LOW. With D+, D– floating, $I_{CC(I/O)F}$ draws less than 1 μ A.
Disable Mode	Connected	Open	Logic controlled inputs pins are Hi-Z

Power-Supply Input Options

The TUSB2551 has two power-supply input options.

- Internal regulator – $V_{CC(5.0)}$ is connected to 4 V to 5.5 V. The internal regulator is used to supply the internal circuitry with 3.3 V (nominal). $V_{reg(3.3)}$ becomes a 3.3-V output reference.
- Regulator bypass – $V_{CC(5.0)}$ and $V_{reg(3.3)}$ are connected to the same supply. The internal regulator is bypassed, and the internal circuitry is supplied directly from the $V_{reg(3.3)}$ power supply. The voltage range is 3 V to 3.6 V to comply with the USB specification.

The supply-voltage range for each input option is specified in [Table 3](#).

Table 3. Power-Supply Input Options
