

PGA103

Programmable Gain AMPLIFIER

FEATURES

- DIGITALLY PROGRAMABLE GAINS:
G=1, 10, 100V/V
- CMOS/TTL-COMPATIBLE INPUTS
- LOW GAIN ERROR: $\pm 0.05\%$ max, G=10
- LOW OFFSET VOLTAGE DRIFT: $2\mu\text{V}/^\circ\text{C}$
- LOW QUIESCENT CURRENT: 2.6mA
- LOW COST
- 8-PIN PLASTIC DIP, SO-8 PACKAGES

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- GENERAL PURPOSE ANALOG BOARDS
- MEDICAL INSTRUMENTATION

DESCRIPTION

The PGA103 is a programmable-gain amplifier for general purpose applications. Gains of 1, 10, or 100 are digitally selected by two CMOS/TTL-compatible inputs. The PGA103 is ideal for systems that must handle wide dynamic range signals.

The PGA103's high speed circuitry provides fast settling time, even at G=100 ($8\mu\text{s}$ to 0.01%). Bandwidth is 250kHz at G=100, yet quiescent current is only 2.6mA. It operates from $\pm 4.5\text{V}$ to $\pm 18\text{V}$ power supplies.

The PGA103 is available in 8-pin plastic DIP and SO-8 surface-mount packages, specified for the -40°C to $+85^\circ\text{C}$ temperature range.

ELECTROSTATIC DISCHARGE SENSITIVITY

Any integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet published specifications.

The information provided herein is believed to be reliable; however, BURR-BROWN assumes no responsibility for inaccuracies or omissions. BURR-BROWN assumes no responsibility for the use of this information, and all use of such information shall be entirely at the user's own risk. Prices and specifications are subject to change without notice. No patent rights or licenses to any of the circuits described herein are implied or granted to any third party. BURR-BROWN does not authorize or warrant any BURR-BROWN product for use in life support devices and/or systems.

TYPICAL PERFORMANCE CURVES

$T_A = +25^\circ\text{C}$, $V_S = \pm 15\text{V}$ unless otherwise noted.

TYPICAL PERFORMANCE CURVES (CONT)

$T_A = +25^\circ\text{C}$, $V_S = \pm 15\text{V}$ unless otherwise noted.

APPLICATION INFORMATION

Figure 1 shows the basic connections required for operation of the PGA103. Applications with noisy or high impedance power supplies may require decoupling capacitors close to the device pins as shown.

FIGURE 1. Basic Connections.

The input and output are referred to the ground terminal, pin 3. This must be a low-impedance connection to assure good gain accuracy. A resistance of 0.1Ω in series with the ground pin will cause the gain in $G=100$ to decrease by approximately 0.2%.

DIGITAL INPUTS

The digital inputs, A_0 and A_1 , select the gain according to the logic table in Figure 1. The digital inputs interface directly to common CMOS and TTL logic components. The logic inputs are referenced to the ground terminal, pin 3.

The logic table in Figure 1 shows that logic “1” on both A_0 and A_1 is invalid. This logic code will not cause damage, but the amplifier output will not be predictable while this code is selected. The output will recover when a valid code is selected.

The digital inputs are not latched, so a change in logic inputs immediately selects a new gain. Switching time of the logic is approximately $0.5\mu s$. The time to respond to gain change is equal to the switching time plus the time it takes the amplifier to settle to a new output voltage in the newly selected gain (see settling time specifications).

Many applications use an external logic latch to access gain control signals from a high speed data bus. Using an external latch isolates the high speed digital bus from sensitive analog circuitry. Locate the latch circuitry as far as practical from analog circuitry to avoid coupling digital noise into the analog circuitry.

PGA103

Some applications select gain of the PGA103 with switches or jumpers. Figure 2 shows pull-up resistors connected to assure a noise-free logic “1” when the switch or jumper is off or open. Fixed-gain applications can connect the logic inputs directly to $V+$ or ground (or other valid logic level) without a series resistor.

FIGURE 2. Switch or Jumper-Selected Gains.

OFFSET TRIMMING

Offset voltage is laser-trimmed to typically less than $200\mu V$ (referred to input) in all three gains. The input-referred offset voltage can be different for each gain.

FIGURE 3. Offset Voltage Trim Circuit.

Figure 3 shows a circuit used to trim the offset voltage of the PGA103. An op amp buffers the trim voltage to provide a low impedance at the ground terminal. This is required to maintain accurate gain. Remember that the logic inputs, A_0 and A_1 , are referenced to this ground connection, so the logic threshold voltage will be affected by the trim voltage. This is insignificant if the offset adjustment is used only to trim offset voltage. If a large offset is used (greater than $0.1V$), be sure that the logic input signals provide valid logic levels when referred to the voltage at the ground terminal, pin 3.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
PGA103U	Active	Production	SOIC (D) 8	75 TUBE	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	PGA 103U
PGA103U.A	Active	Production	SOIC (D) 8	75 TUBE	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	PGA 103U

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
