

FULL DIFFERENTIAL ANALOG INPUT 24-BIT, 192-kHz STEREO A/D CONVERTER

Check for Samples: [PCM1804-Q1](#)

FEATURES

- Qualified for Automotive Applications
- AEC-Q100 Test Guidance With the Following Results:
 - Device Temperature Grade 3: –40°C to 85°C Ambient Operating Temperature Range
 - Device HBM ESD Classification Level H2
 - Device CDM ESD Classification Level C3B
- 24-Bit Delta-Sigma Stereo A/D Converter
- High Performance:
 - Dynamic Range: 112 dB (Typical)
 - SNR: 111 dB (Typical)
 - THD+N: –102 dB (Typical)
- High-Performance Linear Phase Antialias Digital Filter:
 - Pass-Band Ripple: ±0.005 dB
 - Stop-Band Attenuation: –100 dB
- Fully Differential Analog Input: ±2.5 V
- Audio Interface: Master- or Slave-Mode Selectable
- Data Formats: Left-Justified, I²S, Standard 24-Bit, and DSD
- Function:
 - Peak Detection
 - High-Pass Filter (HPF): –3 dB at 1 Hz, f_s = 48 kHz
- Sampling Rate up to 192 kHz
- System Clock: 128 f_s, 256 f_s, 384 f_s, 512 f_s, or 768 f_s

- Dual Power Supplies:
 - 5 V for Analog
 - 3.3 V for Digital
- Power Dissipation: 225 mW
- Small 28-Pin SSOP
- DSD Output: 1 Bit, 64 f_s

APPLICATIONS

- AV Amplifier
- MD Player
- Digital VTR
- Digital Mixer
- Digital Recorder

DESCRIPTION

The PCM1804-Q1 device is a high-performance, single-chip stereo A/D converter with fully differential analog voltage input which uses a precision delta-sigma modulator and includes a linear-phase antialias digital filter and high-pass filter (HPF) that removes DC offset from the input signal. The PCM1804-Q1 device is suitable for a wide variety of mid- to high-grade consumer and professional applications, where excellent performance and 5-V analog supply and 3.3-V digital power-supply operation are required. The PCM1804-Q1 device can achieve both PCM audio and DSD format due to the precision delta-sigma modulator. The PCM1804-Q1 device is fabricated using an advanced CMOS process and is available in a small 28-pin SSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

System Two, Audio Precision are trademarks of Audio Precision, Inc.
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PRINCIPLES OF OPERATION

THEORY OF OPERATION

The PCM1804-Q1 device consists of a band-gap reference, a delta-sigma modulator with full-differential architecture for L-channel and R-channel, a decimation filter with a high-pass filter, and a serial interface circuit. Figure 30 illustrates the total architecture of the PCM1804-Q1 device. An on-chip, high-precision reference with 10- μ F external capacitor(s) provides all the reference voltage needed in the PCM1804-Q1 device, and it defines the full-scale voltage range of both channels. Full-differential architecture provides a wide dynamic range and excellent power-supply rejection performance. The input signal is sampled at $\times 128$, $\times 64$, and $\times 32$ oversampling rates according to the oversampling ratio control, OSR[0:2]. The single rate, dual rate, and quad rate eliminate the external sample-and-hold amplifier. Figure 31 illustrates how for each oversampling ratio the PCM1804-Q1 device decimates, the modulator outputs down to PCM data when the modulator is running at 6.144 MHz. The delta-sigma modulation randomizes the modulator outputs and reduces the idle-tone level. The oversampled data stream from the delta-sigma modulator is converted to a $1/f_s$, 24-bit digital signal, while removing high-frequency noise components using a decimation filter. The DC components of the signal are removed by the HPF, and the HPF output is converted to a time-multiplexed serial signal through the serial interface, which provides flexible serial formats as well as master and slave modes. The PCM1804-Q1 device also has a DSD output mode. The PCM1804-Q1 device can output the signal directly from the modulators to DSDL (pin 16) and DSDR (pin 15).

PRINCIPLES OF OPERATION (continued)

Figure 31. Spectrum of Modulator Output and Decimation Filter

PRINCIPLES OF OPERATION (continued)

SYSTEM CLOCK INPUT

The PCM1804-Q1 device supports $128 f_s$, $192 f_s$ (only in master mode at quad rate), $256 f_s$, $384 f_s$, $512 f_s$, and $768 f_s$ as a system clock, where f_s is the audio sampling frequency. The system clock must be supplied on SCKI (pin 18). Table 3 shows the relationship of typical sampling frequency and the system clock frequency, and Figure 32 shows system clock timing. In master mode, the system clock rate is selected by OSR2 (pin 11), OSR1 (pin 10), and OSR0 (pin 9) as shown in Table 1. In slave mode, the system clock rate is automatically detected. In DSD mode, OSR2 (pin 11), OSR1 (pin 10), OSR0 (pin 9), and the system clock frequency are fixed as shown in Table 1 and Table 3.

PARAMETER		MIN	UNIT

$t_w(SCKL)$	System clock pulse duration, LOW	11	ns

Figure 32. System Clock Input Timing

POWER-ON AND RESET FUNCTIONS

The PCM1804-Q1 device has both an internal power-on-reset circuit and $\overline{RST}$ (pin 19). For internal power-on reset, initialization (reset) is performed automatically at the time when the digital power supply exceeds 2 V (typical) and analog power supply exceeds 4 V (typical). $\overline{RST}$ accepts external forced reset, and a low level on $\overline{RST}$ initiates the reset sequence. Because an internal pulldown resistor terminates $\overline{RST}$, no connection of $\overline{RST}$ is equivalent to a low-level input. Because the system clock is used as a clock signal for the reset circuit, the system clock must be supplied as soon as power is supplied; more specifically, at least three system clocks are required prior to $V_{DD} > 2$ V, $V_{CC} > 4$ V, and $\overline{RST} = \text{high}$. While $V_{DD} < 2$ V (typical), $V_{CC} < 4$ V (typical), or $\overline{RST} = \text{low}$, and $1 / f_s$ (maximum) count after $V_{DD} > 2$ V (typical), $V_{CC} > 4$ V (typical) and $\overline{RST} = \text{high}$, the PCM1804-Q1 device stays in the reset state and the digital output is forced to zero. The digital output is valid after the reset state is released and the time of $1116 / f_s$ has passed. Figure 33 and Figure 34 illustrate the internal power-on-reset and external-reset timing, respectively. Figure 35 illustrates the digital output for power-on reset and $\overline{RST}$ control. The PCM1804-Q1 needs $\overline{RST} = \text{low}$ when control pins are changed or in slave mode when SCKI, LRCK, and BCK are changed.

POWER-DOWN FUNCTION

The PCM1804-Q1 device has a power-down feature that is controlled by $\overline{RST}$ (pin 19). Entering the power-down mode is done by keeping the $\overline{RST}$ input level low for more than $65536 / f_s$. In the master mode, the SCKI (pin 18) is used as the clock signal for the power-down counter. While in the slave mode, SCKI (pin 18) and LRCK (pin 17) are used as the clock signal. The clock(s) must be supplied until the power-down sequence completes. As soon as $\overline{RST}$ goes high, the PCM1804-Q1 device starts the reset-release sequence described in the Power-On and Reset Functions section.

OVERSAMPLING RATIO

The oversampling ratio is selected by OSR2 (pin 11), OSR1 (pin 10), and OSR0 (pin 9) as shown in Table 1 and Table 2. The PCM1804-Q1 device needs $\overline{RST}$ to equal low when logic levels on the OSR2, OSR1, and OSR0 pins are changed.

Table 1. Oversampling Ratio in Master Mode

OSR2	OSR1	OSR0	OVERSAMPLING RATIO	SYSTEM CLOCK RATE

Figure 34. External-Reset Timing

T0051-01

- (1) In the DSD mode, DSDL is also controlled like DSDR.
- (2) The HPF transient response appears initially.

Figure 35. ADC Digital Output for Power-On-Reset and $\overline{RST}$ Control

AUDIO DATA INTERFACE

The PCM1804-Q1 device interfaces the audio system through BCK/DSDL (pin 16), LRCK/DSDBCK (pin 17), and DATA/DSDR (pin 15). The PCM1804-Q1 device needs RST to equal low in the interface mode and/or if the data format is changed.

INTERFACE MODE

The PCM1804-Q1 device supports master mode and slave mode as interface modes, which are selected by $\overline{S/M}$ (pin 8) as shown in [Table 4](#). In master mode, the PCM1804-Q1 device provides the timing of the serial audio data communications between the PCM1804-Q1 device and the digital audio processor or external circuit. While in slave mode, the PCM1804-Q1 device receives the timing for data transfer from an external controller. Slave mode is not available for DSD.

Table 4. Interface Mode

$\overline{S/M}$	MODE
Low	Master mode
High	Slave mode

DATA FORMAT

The PCM1804-Q1 device supports four audio data formats in both master and slave modes, and these data formats are selected by FMT0 (pin 6) and FMT1 (pin 7) as shown in [Table 5](#).

Table 5. Data Format

FMT1	FMT0	FORMAT	MASTER	SLAVE
Low	Low	PCM, left-justified, 24-bit	Yes	Yes
Low	High	PCM, I ² S, 24-bit	Yes	Yes
High	Low	PCM, standard, 24-bit	Yes	Yes
High	High	DSD	Yes	–

INTERFACE TIMING FOR PCM

Figure 36 through Figure 38 show the interface timing for PCM.

(1) Left-Justified Data Format; L-Channel = High, R-Channel = Low

(2) I²S Data Format; L-Channel = Low, R-Channel = High

(3) Standard Data Format; L-Channel = High, R-Channel = Low

T0009-03

NOTE: LRCK and BCK work as outputs in master mode and as inputs in slave mode.

Figure 36. Audio Data Format for PCM

T0018-03

PARAMETERS		MIN	TYP	MAX	UNIT
$t_{(BCKP)}$	BCK period		$1 / (64 f_S)$		
$t_{w(BCKH)}$	BCK pulse duration, HIGH	32			ns
$t_{w(BCKL)}$	BCK pulse duration, LOW	32			ns
$t_{(CKLR)}$	Delay time, BCK falling edge to LRCK valid	-5		15	ns
$t_{(LRCP)}$	LRCK period		$1 / f_S$		
$t_{(CKDO)}$	Delay time, BCK falling edge to DATA valid	-5		15	ns
$t_{(LRDO)}$	Delay time, LRCK edge to DATA valid	-5		15	ns
t_r	Rising time of all signals			10	ns
t_f	Falling time of all signals			10	ns

- (1) Rising and falling times are measured from 10% to 90% of IN/OUT signal swing.
- (2) The load capacitance of all signals is 10 pF.
- (3) The $t_{(BCKP)}$ is fixed at $1 / (64 f_S)$ in case of master mode.

Figure 37. Audio Data Interface Timing for PCM (Master Mode: LRCK and BCK Work as Outputs)

T0017-03

PARAMETERS		MIN	TYP	MAX	UNIT
$t_{(BCKP)}$	BCK period	$1 / (64 f_S)$		$1 / (48 f_S)$

t_f	Falling time of all signals			10	ns

- (1) Rising and falling times are measured from 10% to 90% of IN/OUT signal swing.
- (2) The load capacitance of the DSD BCK, DSDL, and DSDR signal is 10 pF.

Figure 40. Audio Data Interface Timing for DSD (Master Mode Only)

SYNCHRONIZATION WITH DIGITAL AUDIO SYSTEM FOR PCM

In slave mode, the PCM1804-Q1 device operates under LRCK synchronized with the system clock SCKI. The PCM1804-Q1 device does not need a specific phase relationship between LRCK and SCKI, but it does require the synchronization of LRCK and SCKI.

If the relationship between LRCK and SCKI changes more than ± 6 BCK during one sample period due to LRCK or SCKI jitter, internal operation of the ADC halts within $1 / f_s$ and digital output is forced into BPZ code until resynchronization between LRCK and SCKI is completed.

For changes less than ± 5 BCK, resynchronization does not occur and the previously described digital output control and discontinuity do not occur.

Figure 41 shows the ADC digital output for loss of synchronization and resynchronization. During undefined data, the PCM1804-Q1 device may generate some noise in the audio signal. Also, the transition of normal to undefined data and undefined or zero data to normal causes a discontinuity of data on the digital output. This can generate noise in the audio signal. In master mode, synchronization loss never occurs.

HIGH-PASS FILTER (HPF) BYPASS CONTROL FOR PCM

The built-in function for DC component rejection can be bypassed by the BYPAS (pin 12) control. In bypass mode, the DC component of the input analog signal and the internal DC offset are also converted and output in the digital output data.

Table 6. HPF Bypass Control

BYPAS PIN	HPF MODE
Low	Normal (high-pass) mode
High	Bypass (through) mode

OVERFLOW FLAG FOR PCM

The PCM1804-Q1 device has two overflow flag pins, OVFR (pin 20) and OVFL (pin 21). The pins go to high as soon as the analog input goes across the full-scale range. The high level is held for 1.016 s at maximum, and returns to low if the analog input does not go across the full-scale range for the period.

T0020-06

- (1) Applies only for slave mode; the loss of synchronization never occurs in master mode.
- (2) The HPF transient response appears initially.

Figure 41. ADC Digital Output for Loss of Synchronization and Resynchronization

TYPICAL CIRCUIT CONNECTION DIAGRAM

Figure 42 shows a typical circuit connection diagram in the PCM data format operation.

Figure 43. Typical Circuit Connection Diagram for DSD

APPLICATION INFORMATION

BOARD DESIGN AND LAYOUT CONSIDERATIONS

V_{CC} and V_{DD} Pins

The digital and analog power supply lines to the PCM1804-Q1 device should be bypassed to the corresponding ground pins with 0.1- μ F ceramic and 10- μ F tantalum capacitors placed as close to the pins as possible to maximize the dynamic performance of the ADC. Although the PCM1804-Q1 device has two power lines to maximize the potential of dynamic performance, using one common power supply is recommended to avoid unexpected power-supply trouble like latch-up or the power-supply sequence.

V_{IN} Pins

Using 0.01- μ F film capacitors between the left-channel analog input positive pin and left-channel analog input negative pin, and between right-channel analog input positive pin and right-channel analog input negative pin is strongly recommended to remove higher-frequency noise from the delta-sigma input section.

V_{REFX} and V_{COMX} Inputs

Use 0.1- μ F ceramic and 10- μ F tantalum capacitors between the left-channel voltage reference output, right-channel voltage reference output, and corresponding analog ground pins, to ensure low source impedance at ADC references. Use 0.1- μ F tantalum capacitors between left-channel analog common-mode voltage, right-channel analog common-mode voltage and corresponding analog ground pins to ensure low source impedance of common voltage. These capacitors should be located as close as possible to the left-channel voltage reference output, right-channel voltage reference output, left-channel analog common-mode voltage, and right-channel analog common-mode voltage pins to reduce dynamic errors on references and common voltage. The DC voltage level of these pins is 2.5 V.

DATA/DSDR, BCK/DSDL, and LRCK/DSDBCK Pins

The DATA/DSDR, BCK/DSDL, and LRCK/DSDBCK pins in master mode have large load drive capability. Locating the buffer near the PCM1804-Q1 device and minimizing the load capacitance, minimizes the digital-analog crosstalk and maximizes the dynamic performance of the ADC.

System Clock

The quality of the system clock can influence dynamic performance because the PCM1804-Q1 device operates based on a system clock. Therefore, it might be necessary to consider the system clock duty, jitter, and the time difference between system clock transition and BCK/DSDL or LRCK/DSDBCK transition in slave mode.

Reset Control

If capacitors larger than 10 μ F are used on left-channel voltage reference output and right-channel voltage reference output, an external reset control with a delay time corresponding to the left-channel voltage reference output and right-channel voltage reference output response is required. Also, it works as a power-down control.

APPLICATION CIRCUIT FOR SINGLE-ENDED INPUT

An application diagram for a single-ended input circuit is shown in [Figure 44](#). The maximum signal input voltage and differential gain of this circuit is designed as $V_{in(max)} = 8.28 V_{pp}$, $A_d = 0.3$. Differential gain (A_d) is given by $R_3 / R_1(R_4 / R_2)$ in a circuit configured as a normal inverted-gain amplifier. Resistor R_5 (R_6) in the feedback loop gives low-impedance drive operation and noise filtering for the analog input of the PCM1804-Q1 device. The circuit technique using R_5 (R_6) is recommended.

S0059-01

- (1) A capacitor value of 1800 pF is recommended, unless an input signal greater than –6 dBFS at 100 kHz or higher is applied in the DSD mode. In that case, 3300 pF is recommended.

REVISION HISTORY

Changes from Original (June 2012) to Revision A	Page
• Changed part number from PCM1804-ME to PCM1804-Q1.	1
• Added table note under recommended operating conditions table.	4

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
PCM1804S1IDBRQ1	Active	Production	SSOP (DB) 28	2000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	PCM1804Q
PCM1804S1IDBRQ1.B	Active	Production	SSOP (DB) 28	2000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	PCM1804Q

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
